

## COMMUNITY INFORMATION

### PROFERTIL informs its neighbors

**Ingeniero White, June 28.** Profertil informs that this Monday, June 28, a scheduled plant Turnaround will begin, the purpose of which is to provide greater reliability to the plant. This is a maintenance shutdown that will last approximately 60 days.

As is usual in this type of work, during the initial stage of the work - when the plant is actually shut down - there will be an increased brightness in the flares, as a result of the controlled combustion of the process gases remaining in the equipment. This, it is important to note, presents no risk to the community or the environment: it is the worldwide standard procedure for delivering the equipment safely. In the attached clip you can see how this equipment works: <https://www.youtube.com/watch?v=FzvRjW-fVDE>

The tasks to be carried out all have the safety of people and care for the environment as priorities. Among the main actions, the following stand out: replacement of catalysts, heat exchangers, steam superheater in the primary reformer, screens, floors and nozzles in the granulators, and trays in the urea plant.

The contact channels for any concerns that may arise are the usual ones, both through the company's website ([www.profertil.com.ar](http://www.profertil.com.ar)) and through social networks, where the company is listed as @profertilagro.
