

PLANT NEWS

PROFERTIL informs the community

Ingeniero White, December 16. – The company reports that today its production plants shut down due to the interruption in the electrical supply caused by the severe storm that hit the city. We will inform when the startup maneuvers begin.

As usual in these tasks, increased brightness is expected in the plant's flares, and occasionally, there may be an increase in noise levels. The noise increase is due to the heating of the facilities when the process gases start circulating again, while the increased brightness of the torches is associated with the safe and controlled combustion of residual gases.

The municipal, provincial, and national authorities have been duly informed. The usual contact channels for any concerns are available, including the company's website (www.profertil.com.ar) and its social media platforms.
